

***PLATFORM «FROM GENE TO LEAD COMPOUND»:
INTEGRATION IN SILICO AND IN VITRO TECHNOLOGIES***

Prof. A. S. Ivanov

Novosibirsk - 2008

Integral Pipeline “From Gene to Drug”

Comparative genomes analysis

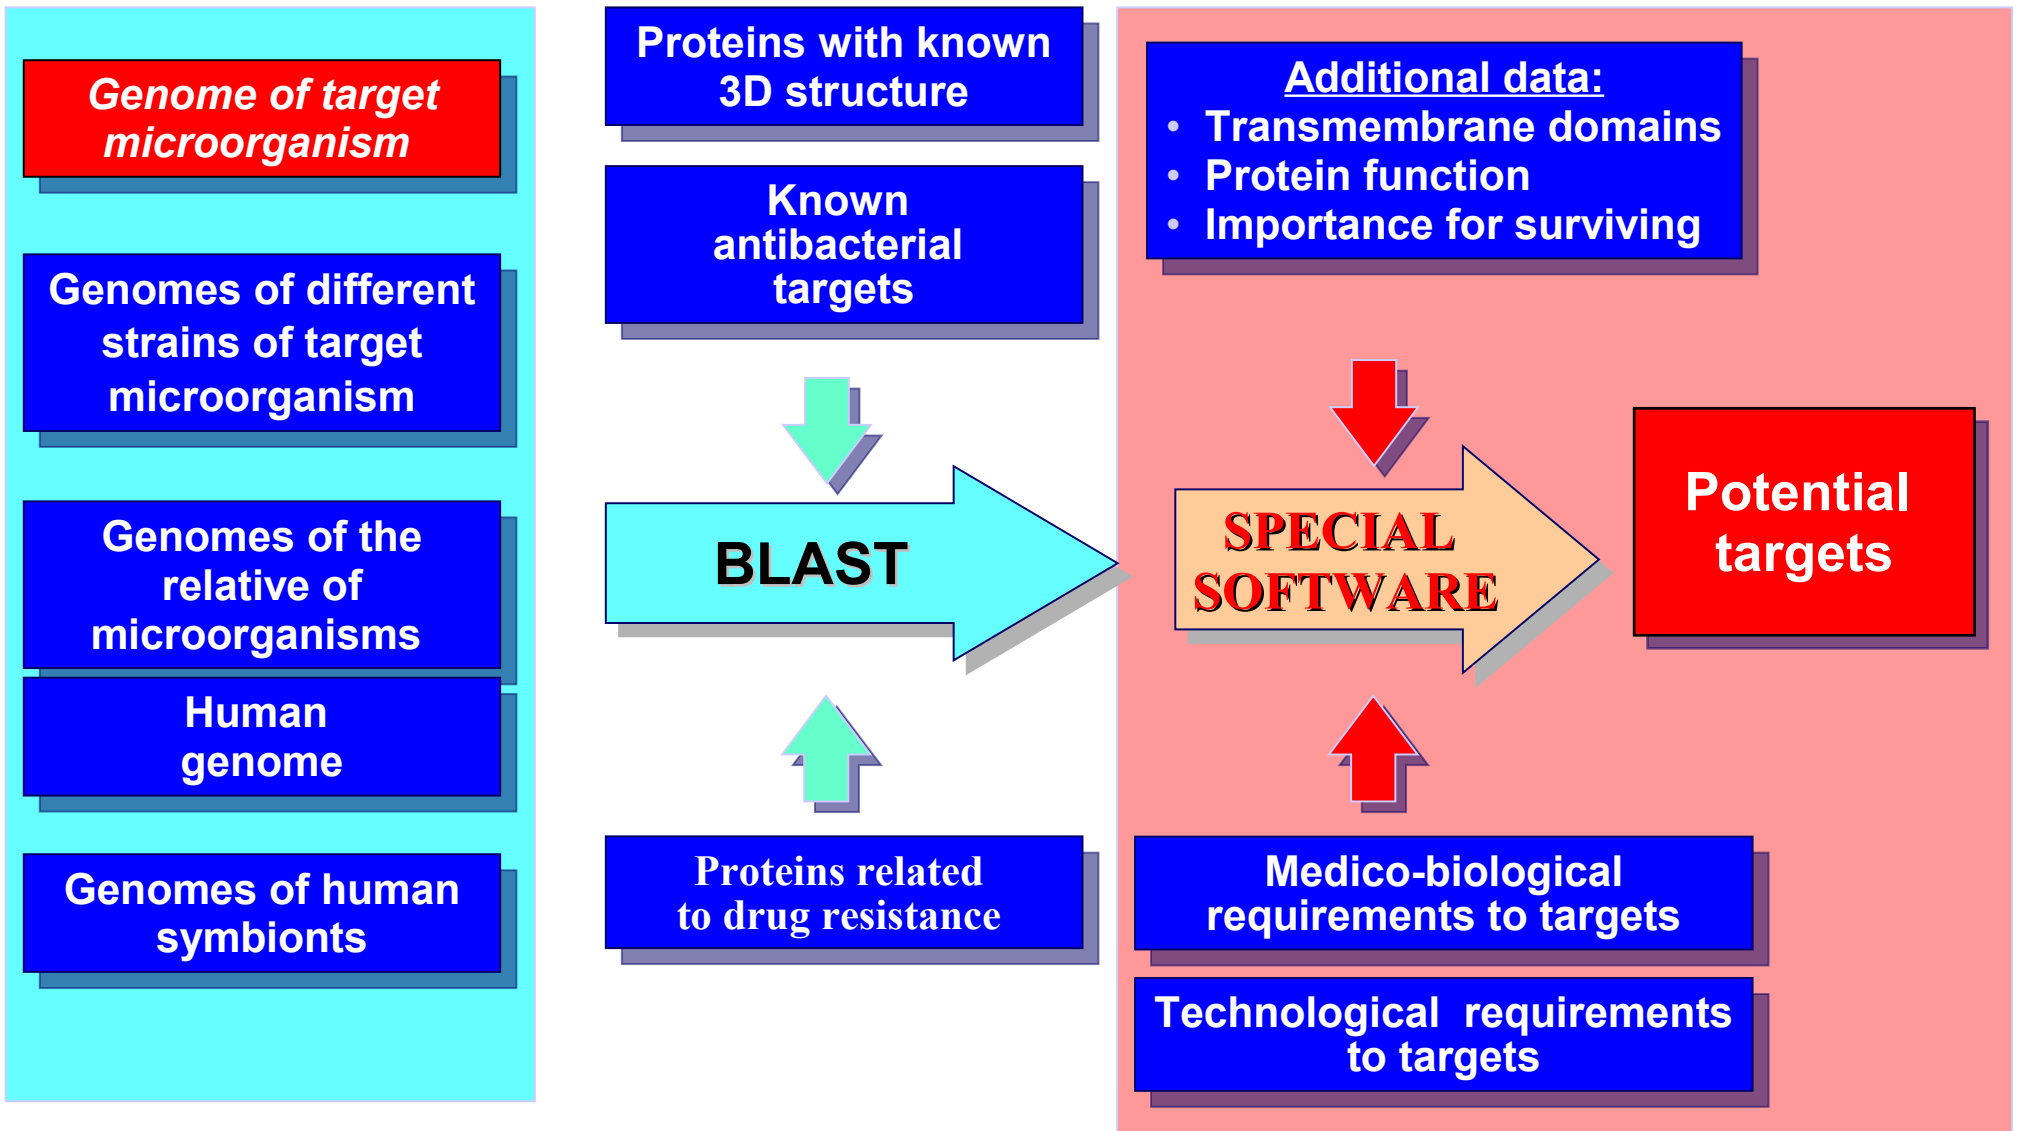

***Let's consider the example
of molecular targets search
for new antibacterial drugs***

Requirements of “IDEAL” antimicrobial agent and to its target

Drug	Target
Biomedical requirements	
Effective suppression of growth and reproduction of micro-organism	Important for growth and reproduction
Lethality to pathogen	Essential for survival
Definite antimicrobial spectrum	Occurs in all target microbial species and strains
Selectivity: minimal host toxicity	Absent in host (human)
Selectivity: minimal alteration of normal microflora	Absent in host's (human) symbiont bacteria
Low risk of resistance	Conserved in all target strains
Technological requirements	
Target-based CADD	Available 3D structure
Definite mechanism of action	Known function

CADD, computer-aided drug discovery.

Comparative genomes analysis

Target selection in genome of *Mycobacterium tuberculosis*

Potential Targets Found in Genome of *M. tuberculosis*

Target no.	Gene	Target protein
1.	<i>infA</i>	Translation initiation factor IF-1
2.	<i>hupB</i>	Histone-like protein
3.	<i>rpoA</i>	DNA-directed RNA polymerase (transcriptase) alpha chain
4.	<i>rpsD</i>	30S ribosomal protein S4
5.	<i>rpsE</i>	30S ribosomal protein S5
6.	<i>rpsH</i>	30S ribosomal protein S8
7.	<i>bfrA</i>	Bacterioferritin
8.	<i>kdtB</i>	Phosphopantetheine adenylyltransferase
9.	<i>glcB</i>	Malate synthase G
10.	<i>purE</i>	Phosphoribosylaminoimidazole carboxylase catalytic subunit
11.	<i>ruvA</i>	Holliday junction DNA helicase
12.	<i>trpB</i>	Tryptophan synthase beta chain
13.	<i>mscL</i>	Large-conductance mechanosensitive channel

Bioinformatics Platform Development

Integral Pipeline “From Gene to Drug”

What method of target validation to choose?

Loss-of-function strategies: Which way to go?

Targets validation approaches

The main tasks of targets validation:

- maximal reduction in the number of potential targets*
- obtainment of additional information for target prioritization*

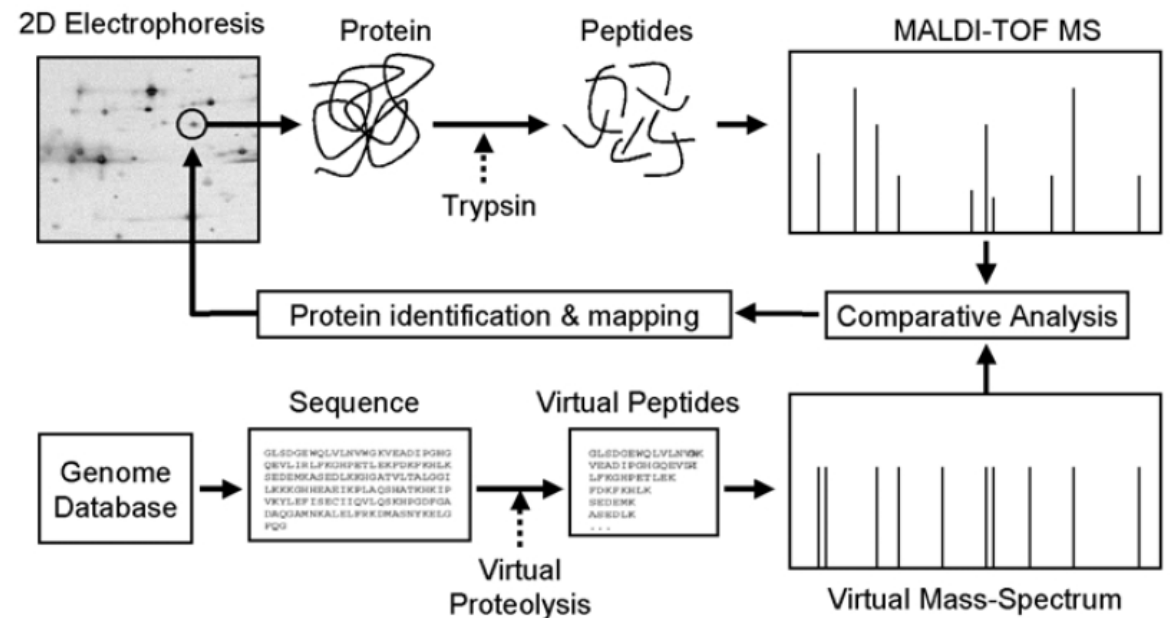

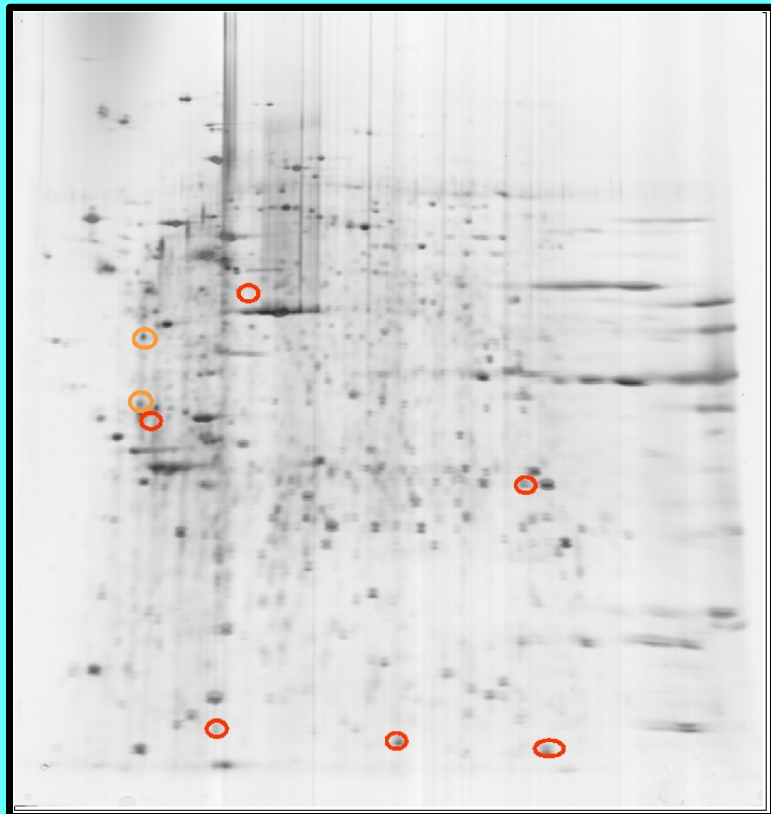

1. Proteomic methods

2. Genomic methods

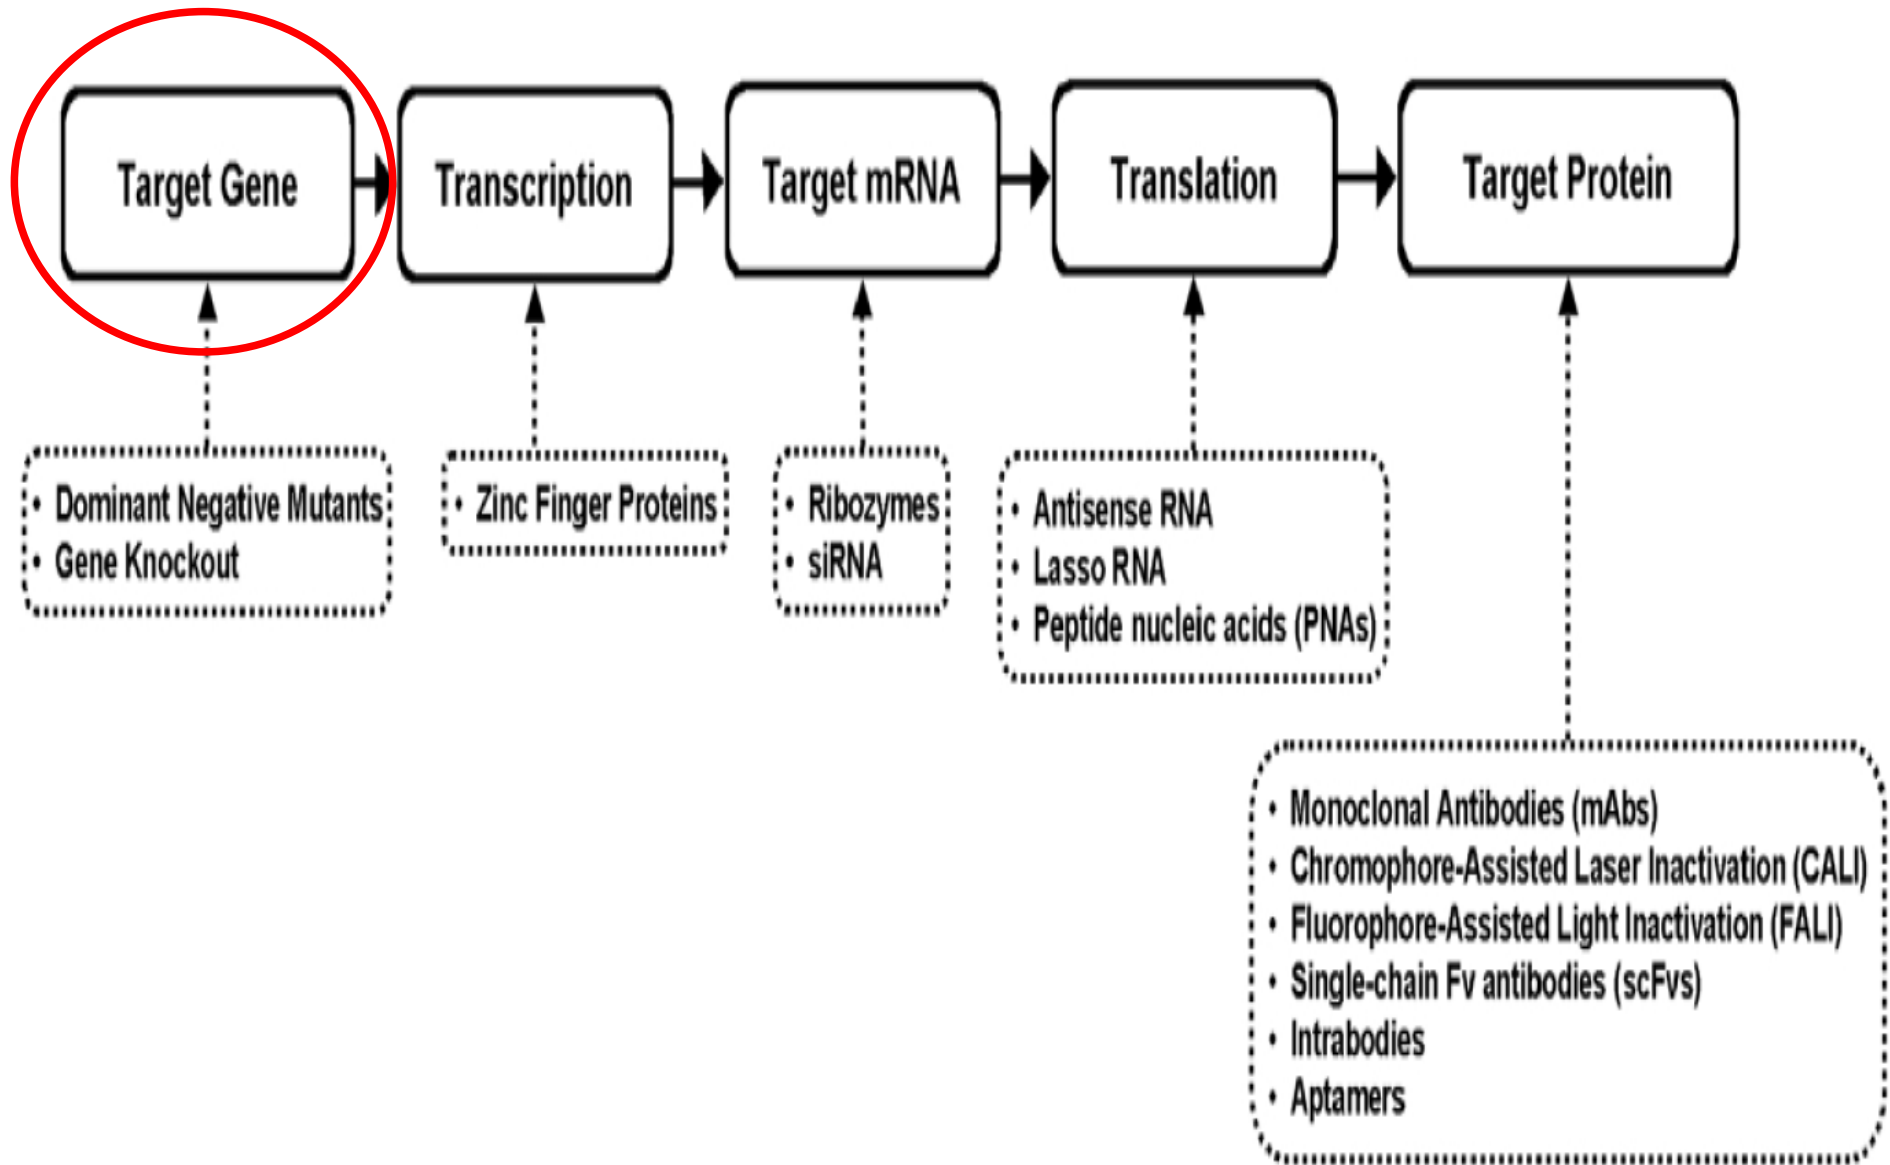

3. Target inactivation

1. Proteomic methods of target validation

- Examination of target proteins expression
- Examination of Target Expression In Different Strains
- Analysis of protein-protein interactions

2. Genomic methods of target validation

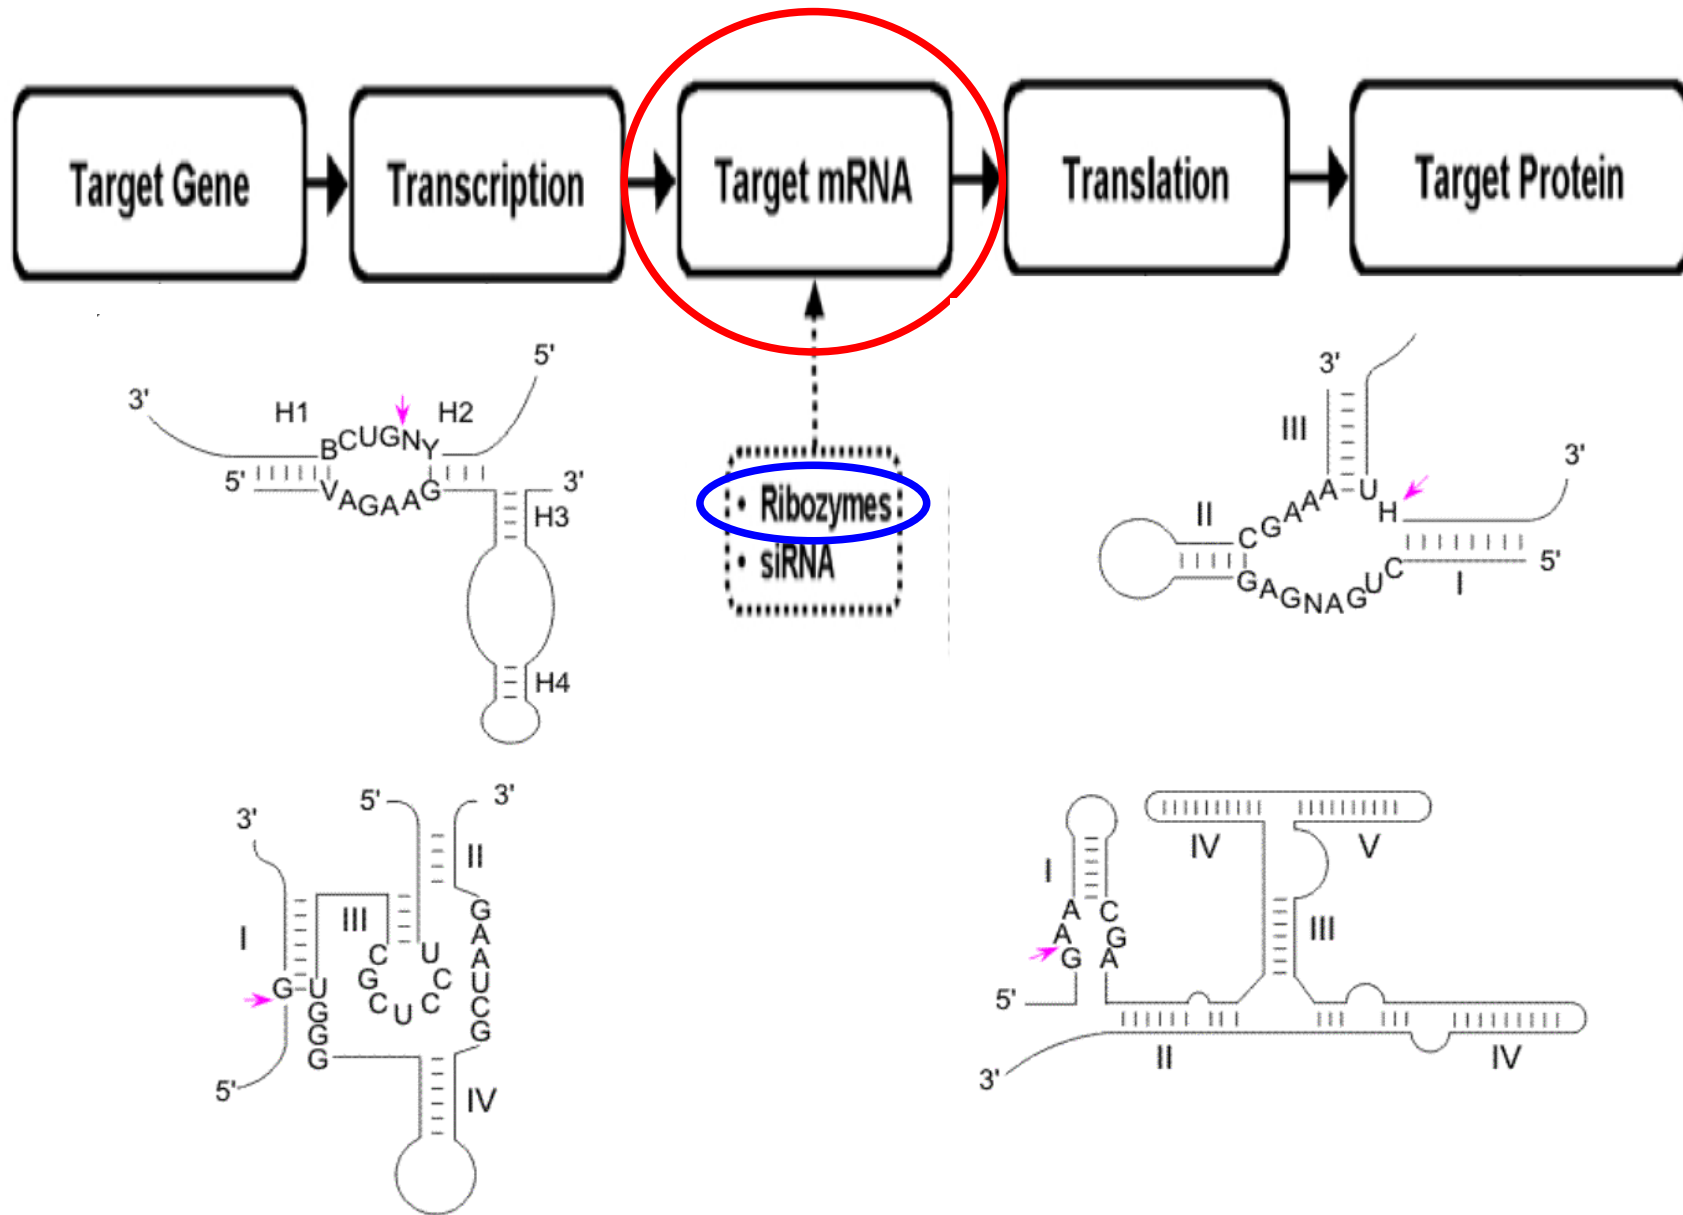

2. Genomic methods of target validation

Zinc Finger Proteins

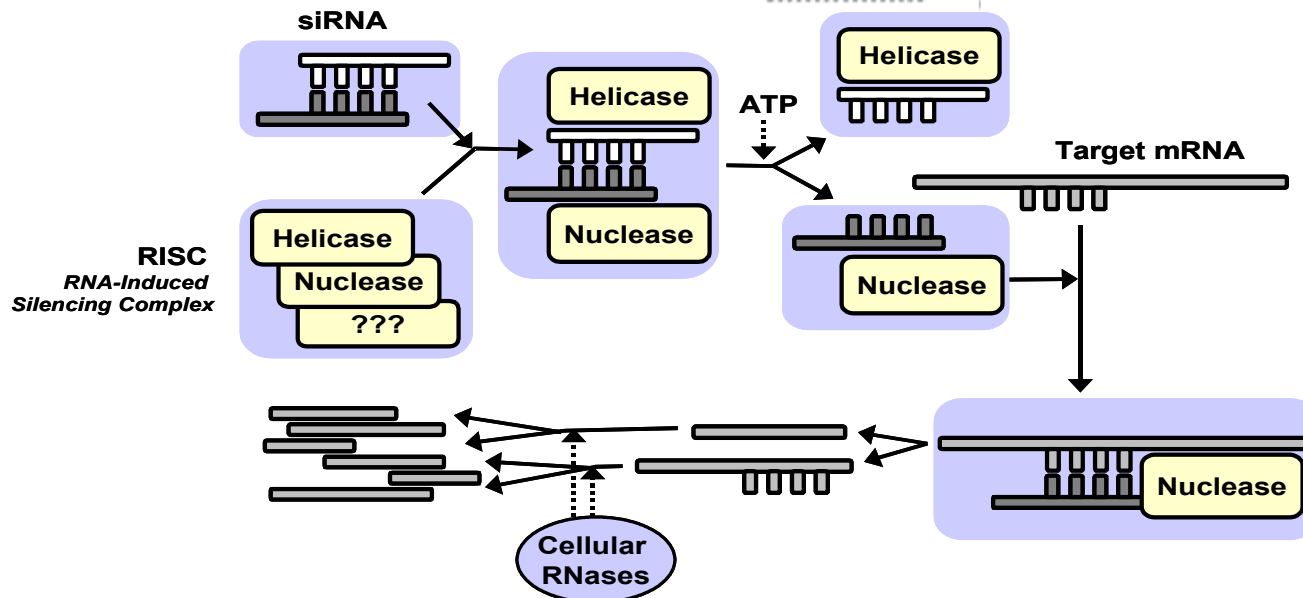

2. Genomic methods of target validation

2. Genomic methods of target validation

RNA interference

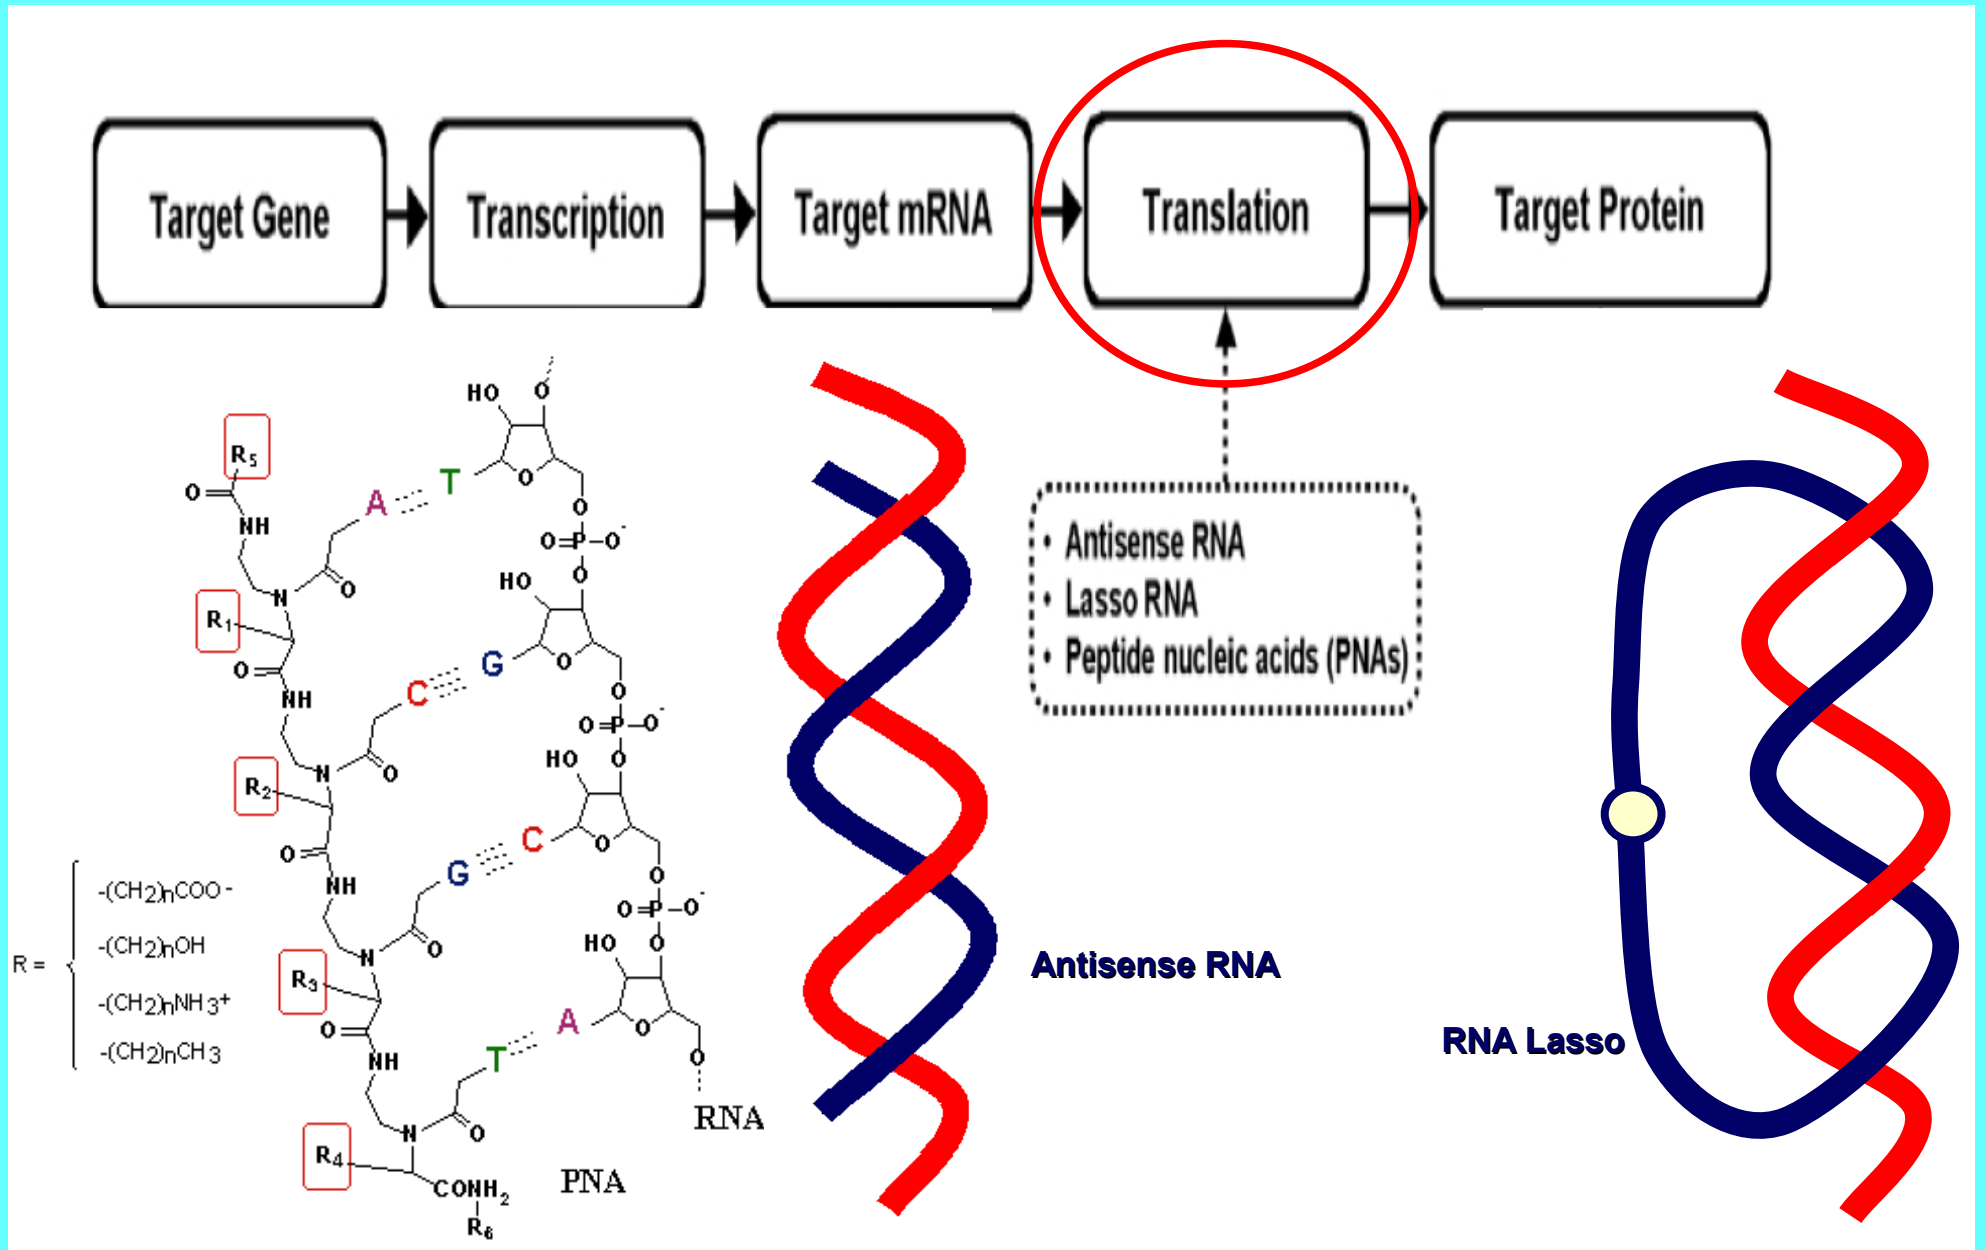

Andrew Fire

Craig C Mello

**Nobel Prize 2006
in physiology and
medicine**

2. Genomic methods of target validation

3. Target inactivation

CALI

**Chromophore-Assisted
Laser Inactivation**

FALI

**Fluorophore-Assisted Light
Inactivation**

- Monoclonal Antibodies (mAbs)
- **Chromophore-Assisted Laser Inactivation (CALI)**
- **Fluorophore-Assisted Light Inactivation (FALI)**
- Single-chain Fv antibodies (scFvs)
- Intrabodies
- Aptamers

3. Target inactivation

Single-chain Fv antibodies

- Monoclonal Antibodies (mAbs)
- Chromophore-Assisted Laser Inactivation (CALI)
- Fluorophore-Assisted Light Inactivation (FALI)
- **Single-chain Fv antibodies (scFvs)**
- Intrabodies
- Aptamers

3. Target inactivation

Aptamers

- Monoclonal Antibodies (mAbs)
- Chromophore-Assisted Laser Inactivation (CALI)
- Fluorophore-Assisted Light Inactivation (FALI)
- Single-chain Fv antibodies (scFvs)
- Intrabodies
- **Aptamers**

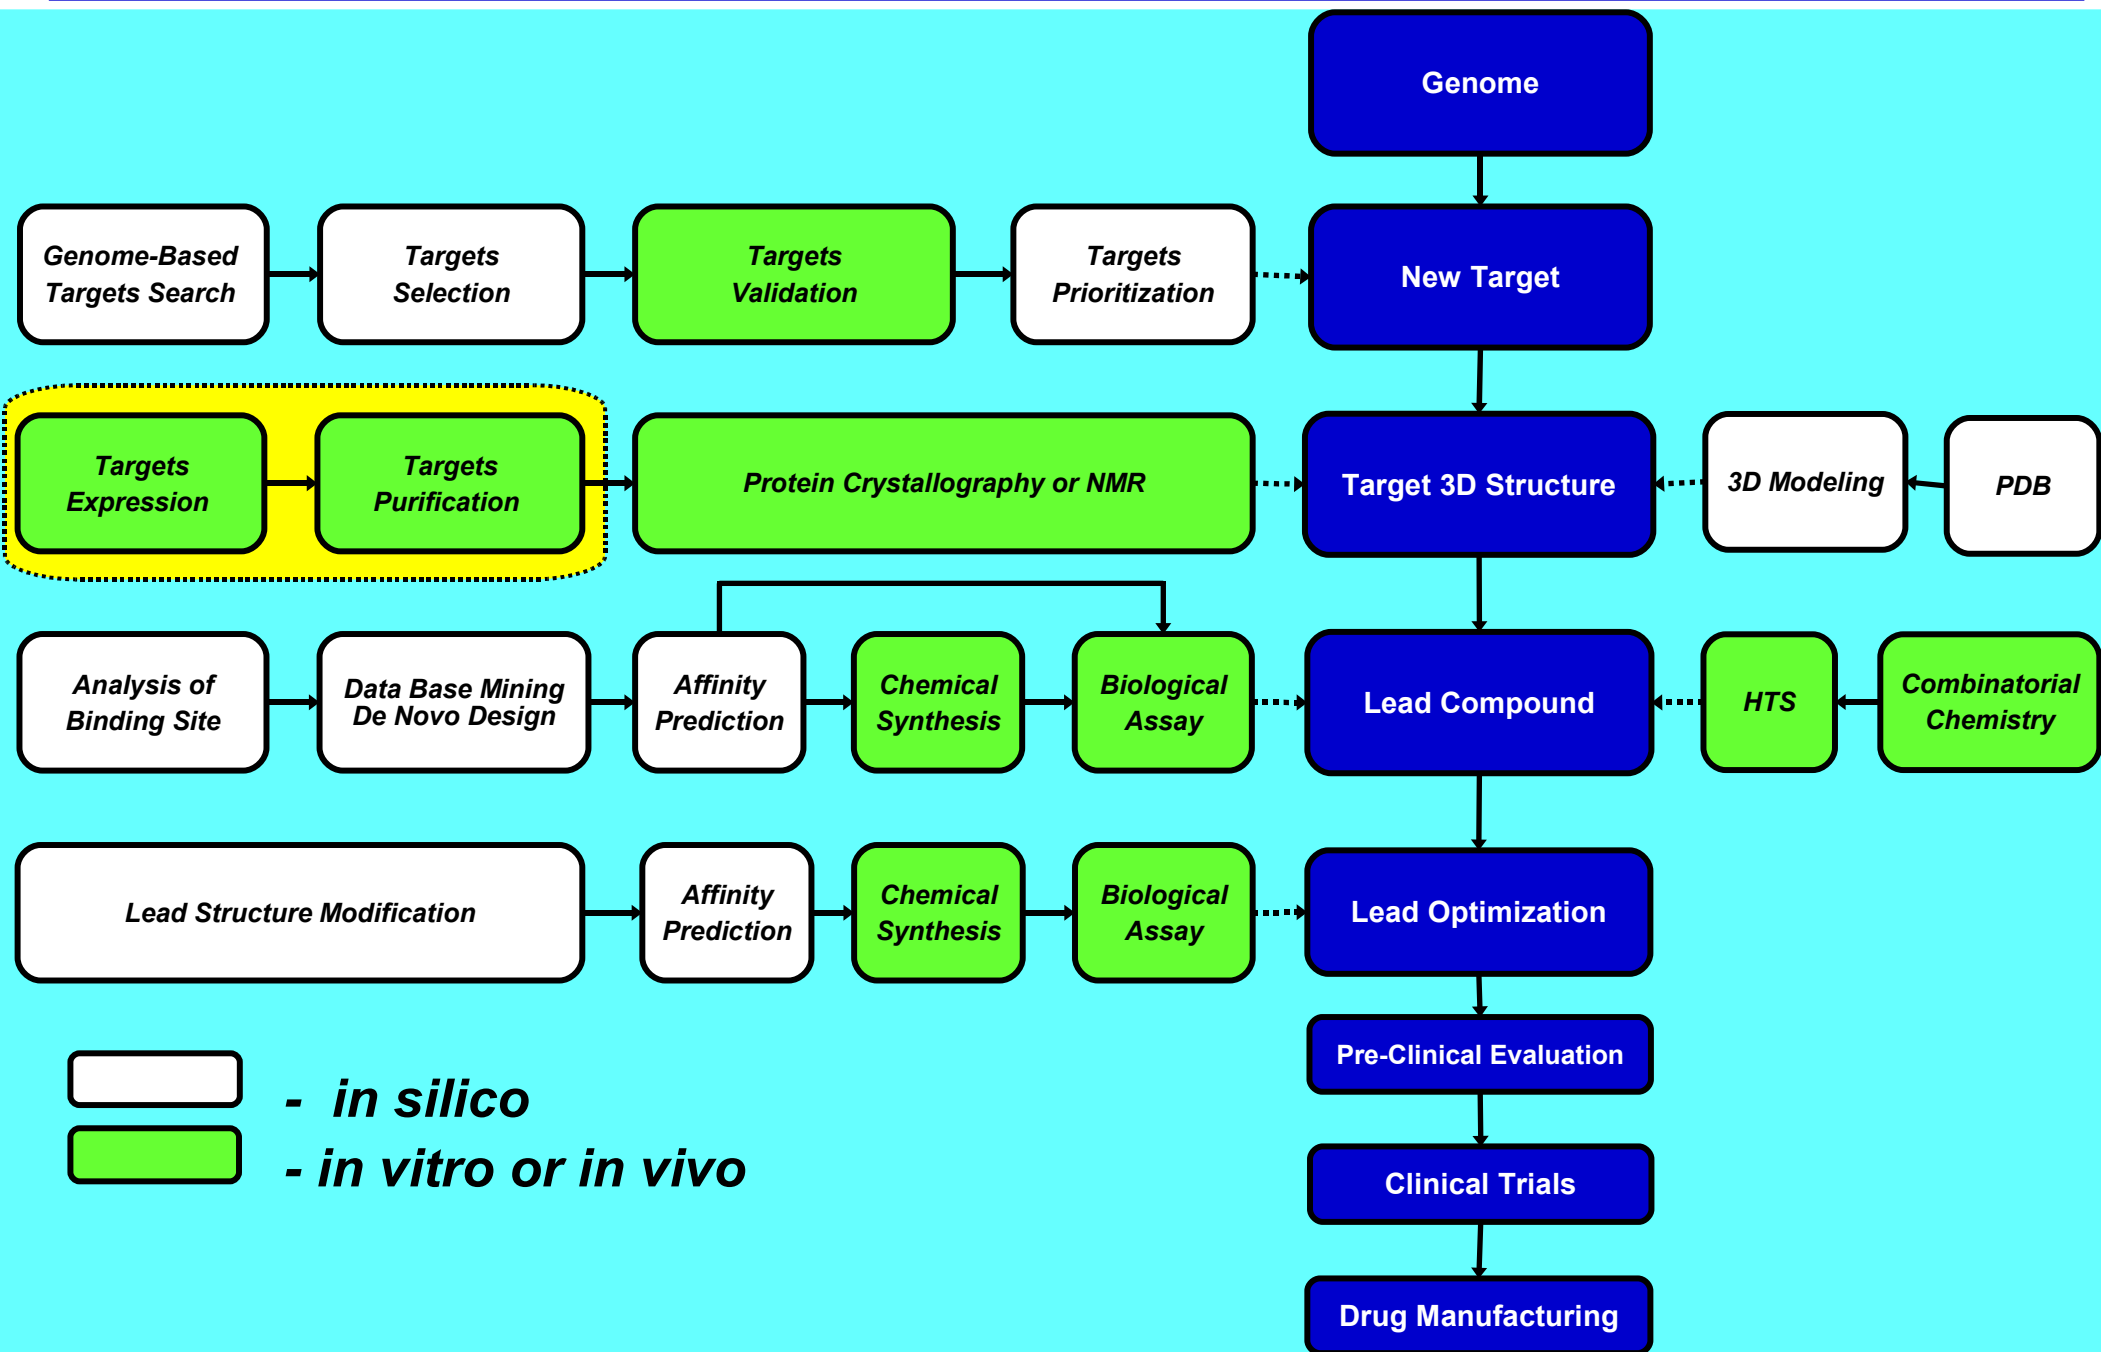

Integral Pipeline “From Gene to Drug”

Biological testing in vitro

- High sensitivity
- Very small samples
- Short time of analysis
- Different optical chips

2b. Sensor surfaces

- A wide selection of sensor surfaces to maximize application flexibility
- Highest quality sensor surfaces to minimize non-specific binding and give excellent reproducibility

In vitro assay for inhibitors of HIVp dimerization

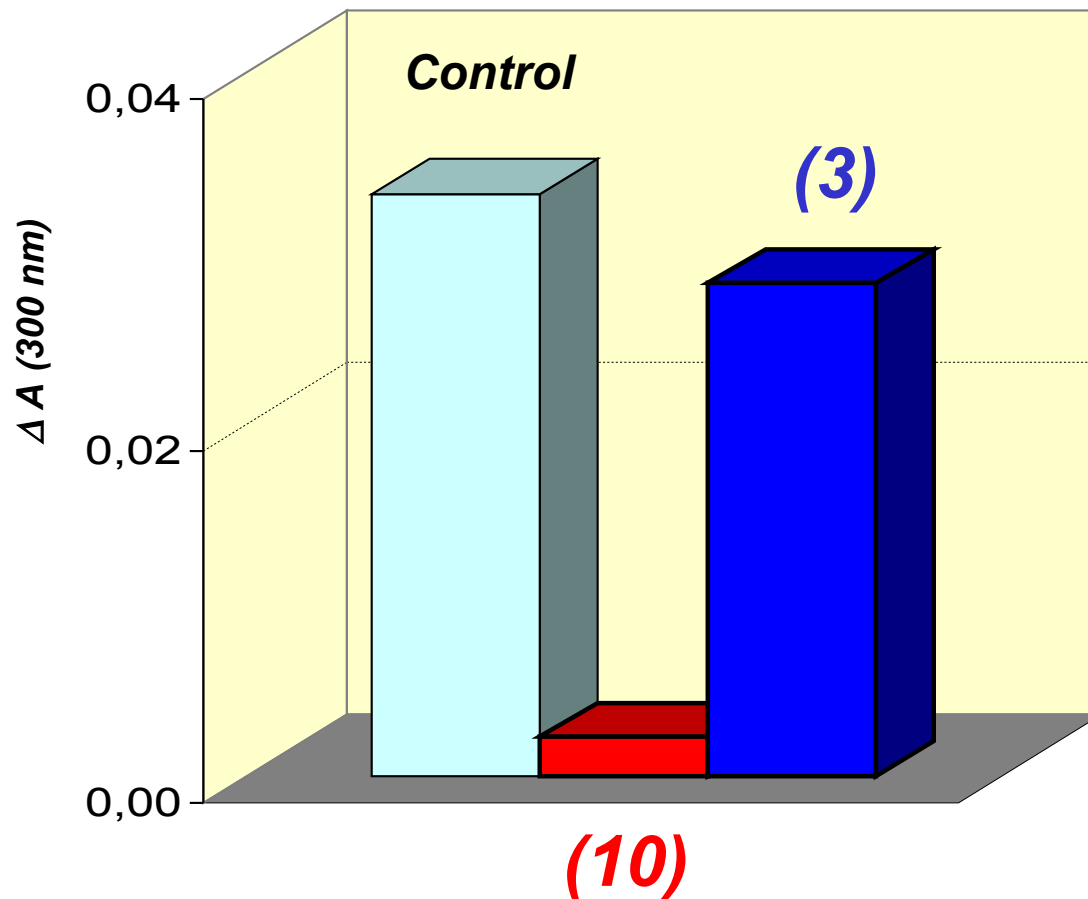

In vitro assay for HIVp inhibition

- ✓ The ability of selected compounds to inhibit HIVp was assessed with chromogenic peptide substrate:

- ✓ Spectrophotometric assay - ΔA (300 nm) is proportional to HIVp activity

*Ligands
concentration is
 10^{-6} M*
