of the Russian Academy of Sciences, Novosibirsk,
Russia**

Tools for computer structural biology

PDBSite: a functional site database

PDBSiteScan: a program for functional site recognition

PDBSiteComplex: a program for molecular complex reconstruction

WebProAnalyst: a program for quantitative structure-activity relationships analysis in protein families

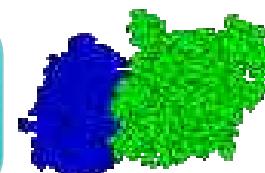

Protein function annotation

Molecular evolution

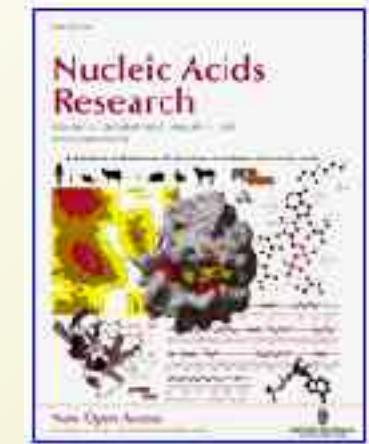

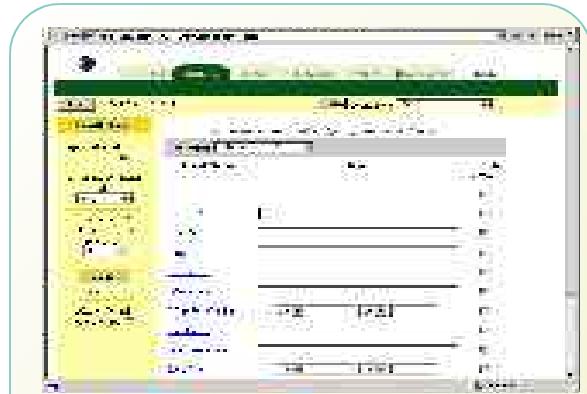

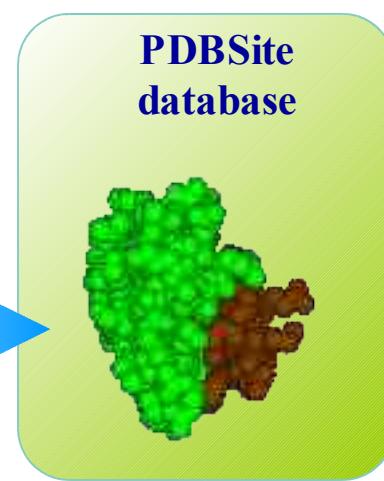

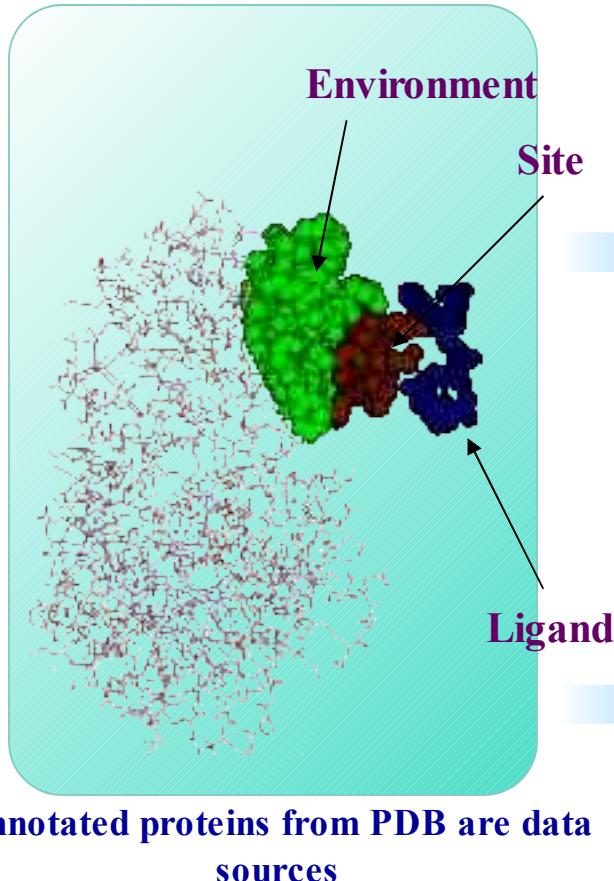

Search for drug targets

Data on spatial structure and main features of functional sites of proteins and their ligands are accumulating in the PDBSite and PDBLigand databases

<http://wwwmgs.bionet.nsc.ru/mgs/gnw/pdbsite/>

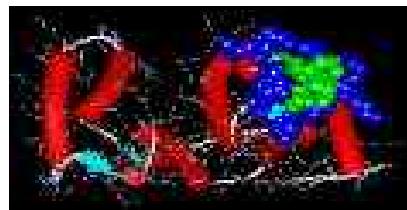

Ivanisenko et al, (2005)
Nucleic Acids Res.

The PDBSite database contains

Drug binding (50)

Protein-DNA (2,700)

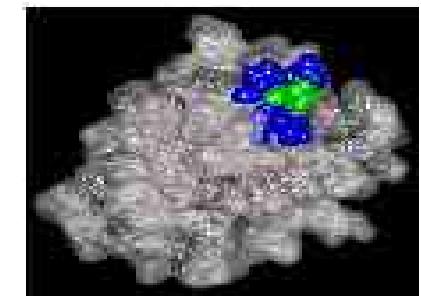

Binding sites

Protein-RNA (2,000)

Protein-protein
(1,000)

Active (1,300)

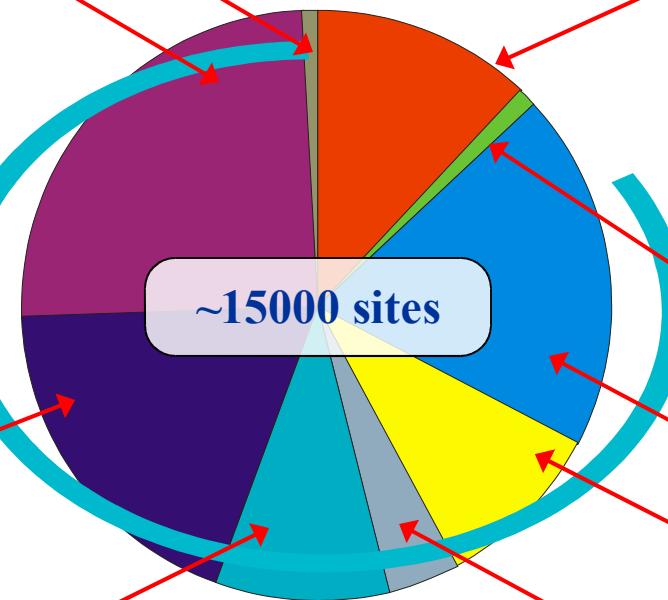

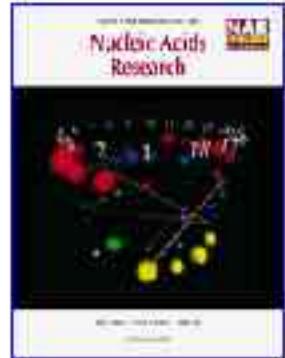

Posttranslational
modifications (100)

Organic ligands
(2,100)

Metal ions (1000)

Inorganic ligands
(400)

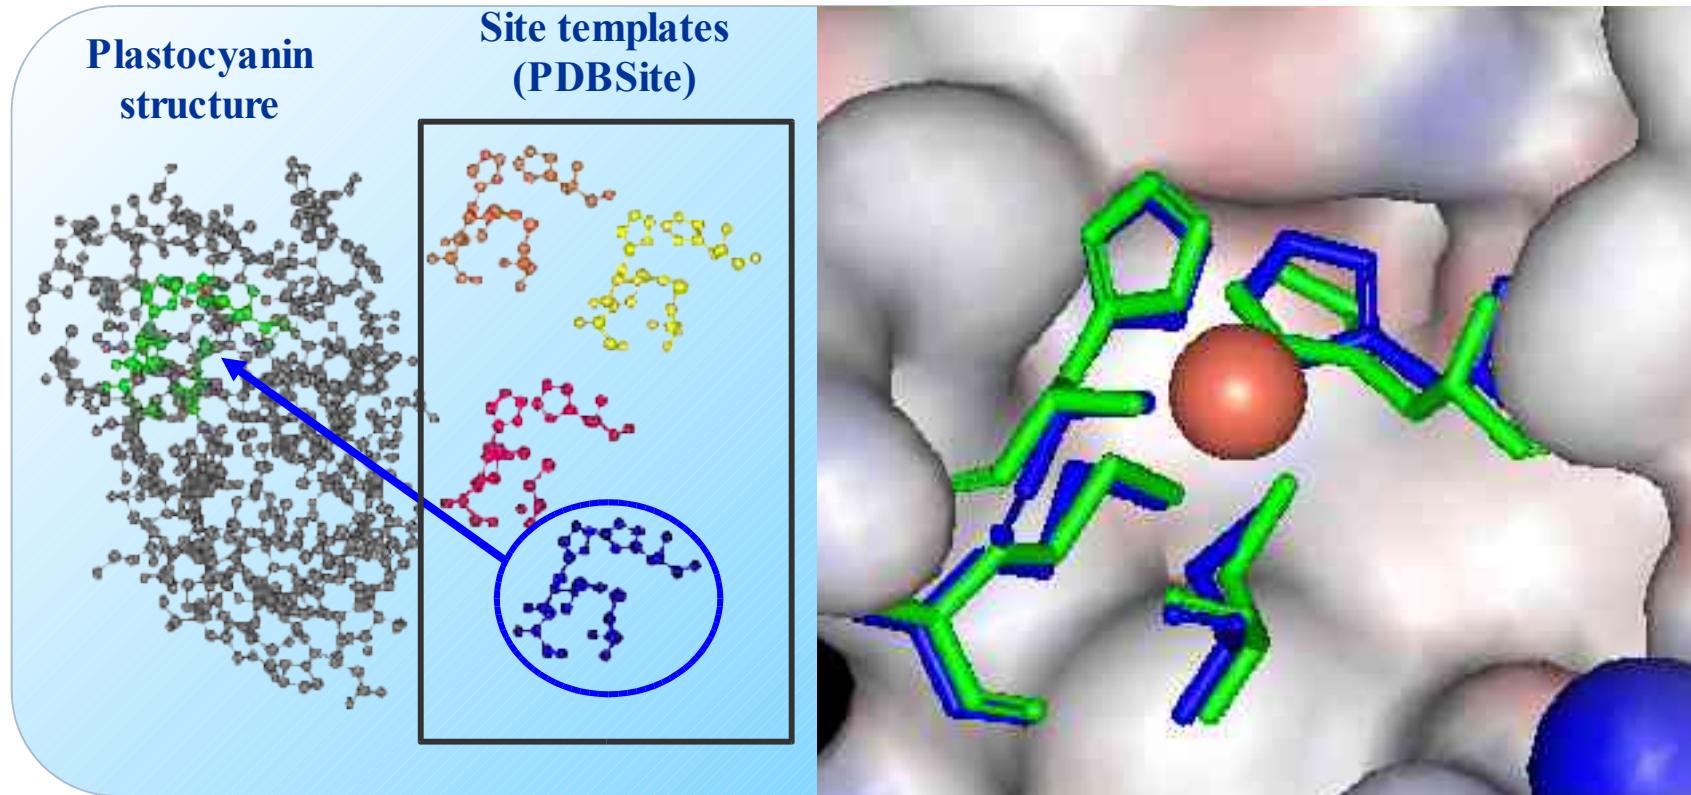

PDBSiteScan: a program for the recognition of functional site

<http://wwwmgs.bionet.nsc.ru/mgs/systems/fastprot/pdbsitescan.html>

Ivanisenko et al, (2004)
Nucleic Acids Res.

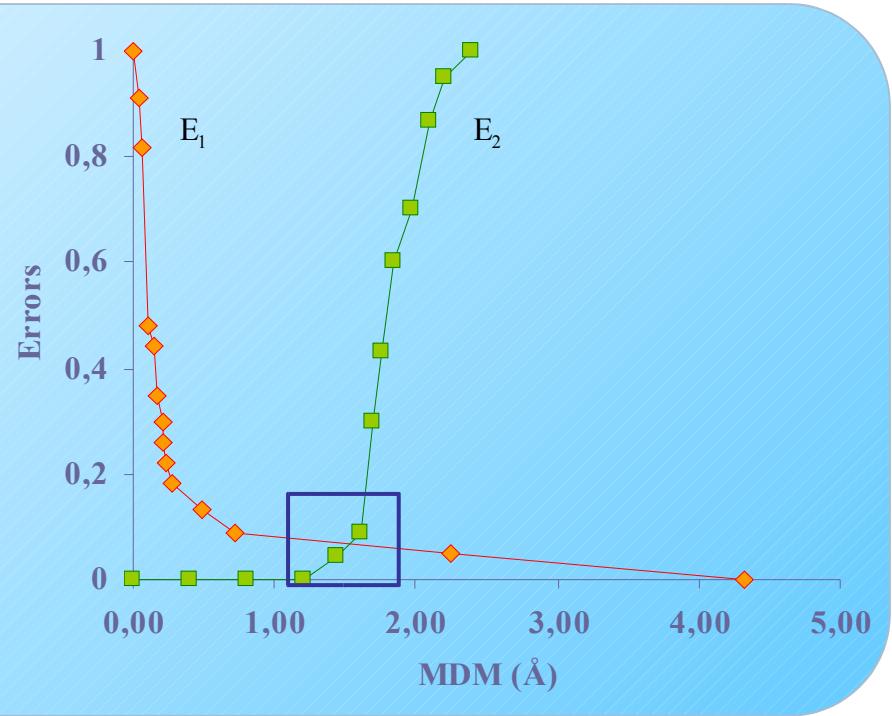

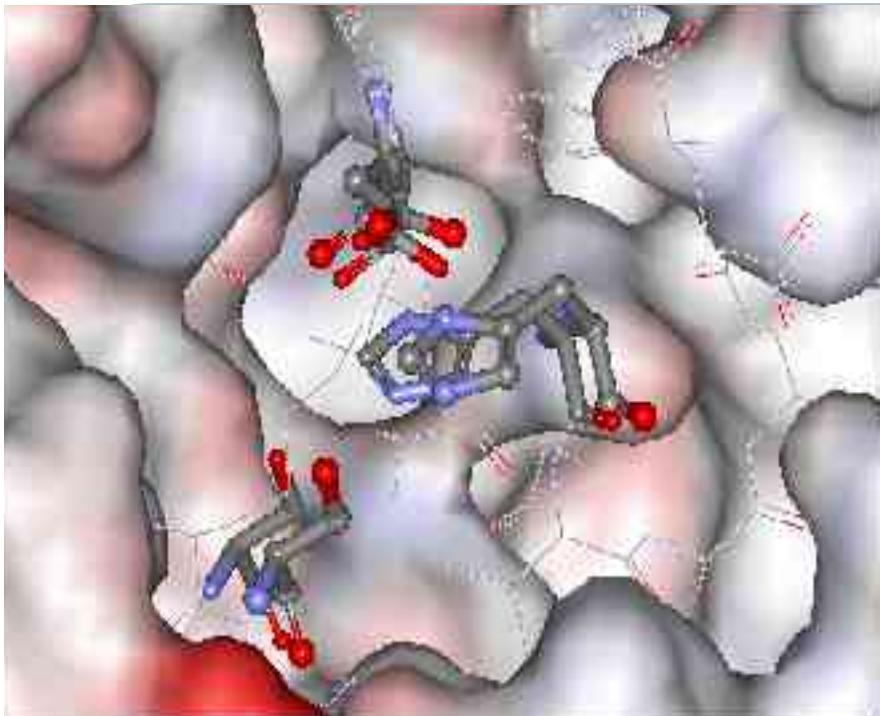

Example. Search for copper binding site in plastocyanin (PDB ID 1BXU)

The residues of the recognized site in plastocyanin are in green, those of template site from the PDBSite database (ID 1B3ICU) are in blue. Orange ball highlights copper ion.

Accuracy estimation for catalytic center recognition in hydrolase superfamily

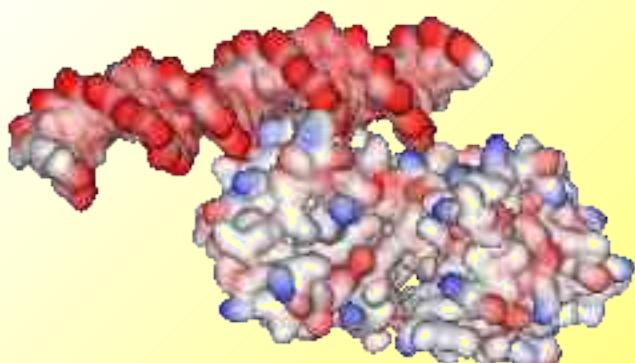

MDM – maximum distance mismatch between site template and protein fragment.

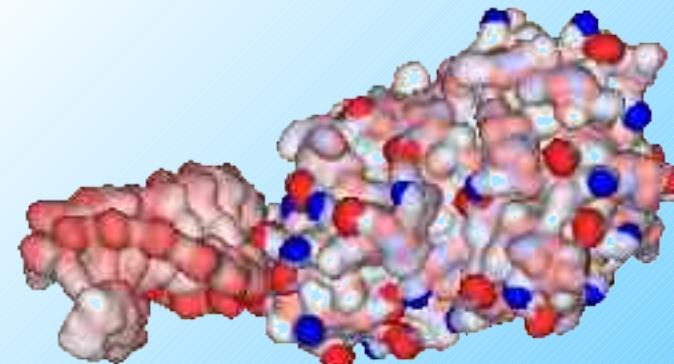

E₁ – type I error (underprediction)

E₂ – type II error (overprediction)

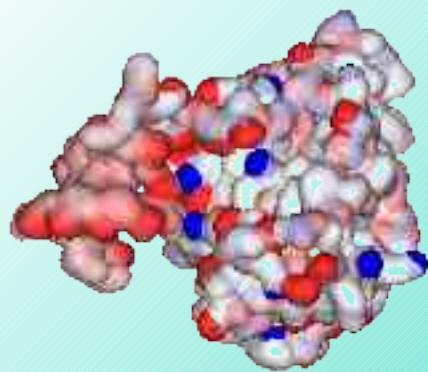

PDBSiteComplex: tools for reconstruction of interactions between proteins and DNAs/RNAs

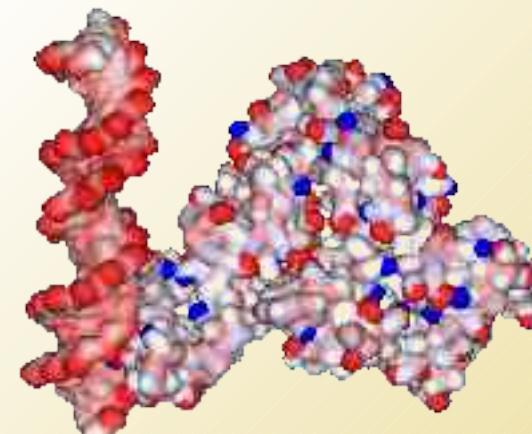

Phosphoglycerate kinase 1 - DNA

Glyceraldehyde-3-phosphate-dehydrogenase (GPD) - RNA

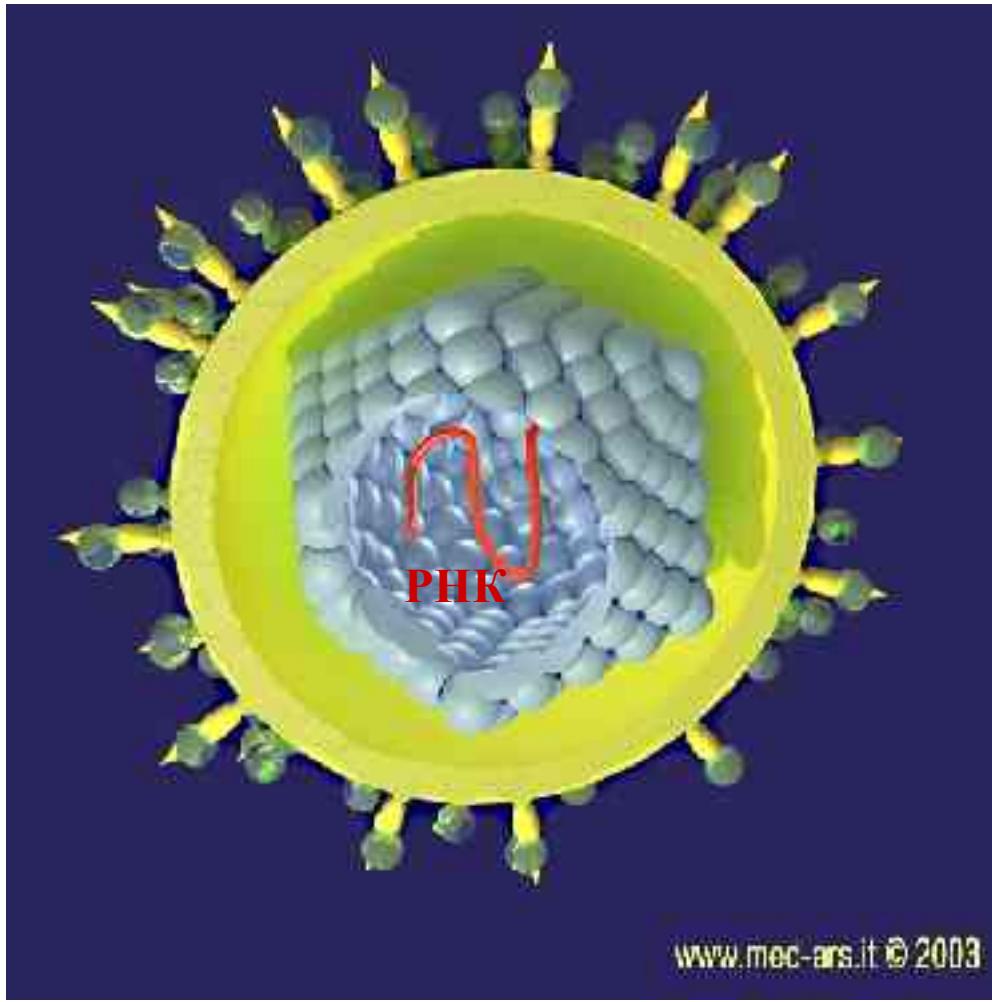

N-terminal domain of heat shock protein HSP90 - RNA

Serum albumin - DNA

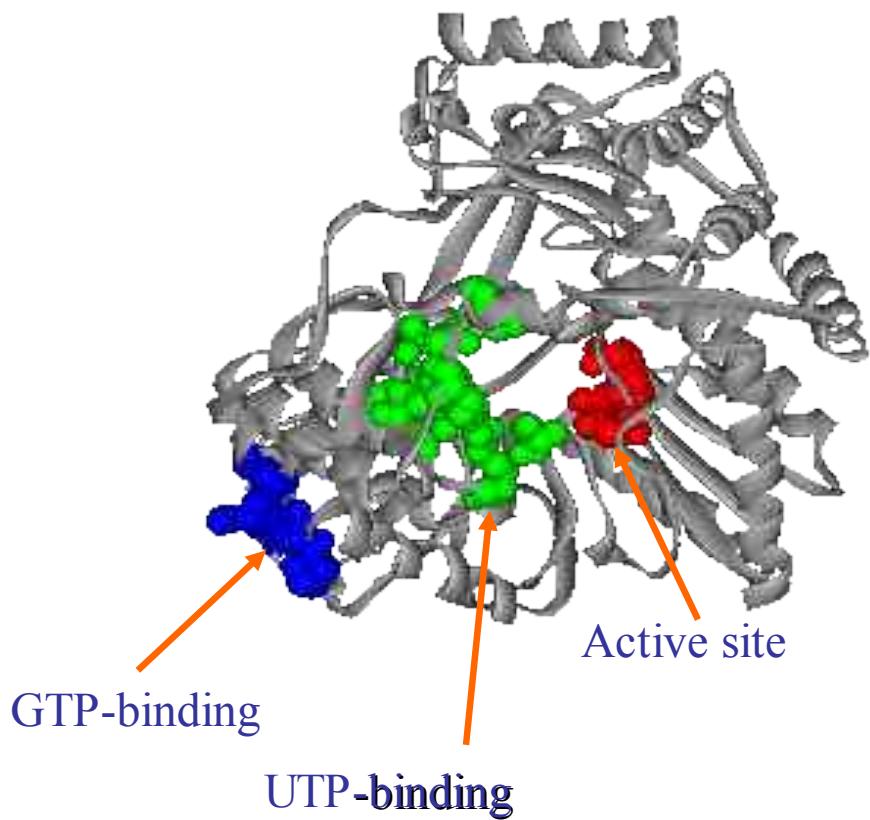

Hepatitis C virus: search for potential antiviral drug targets

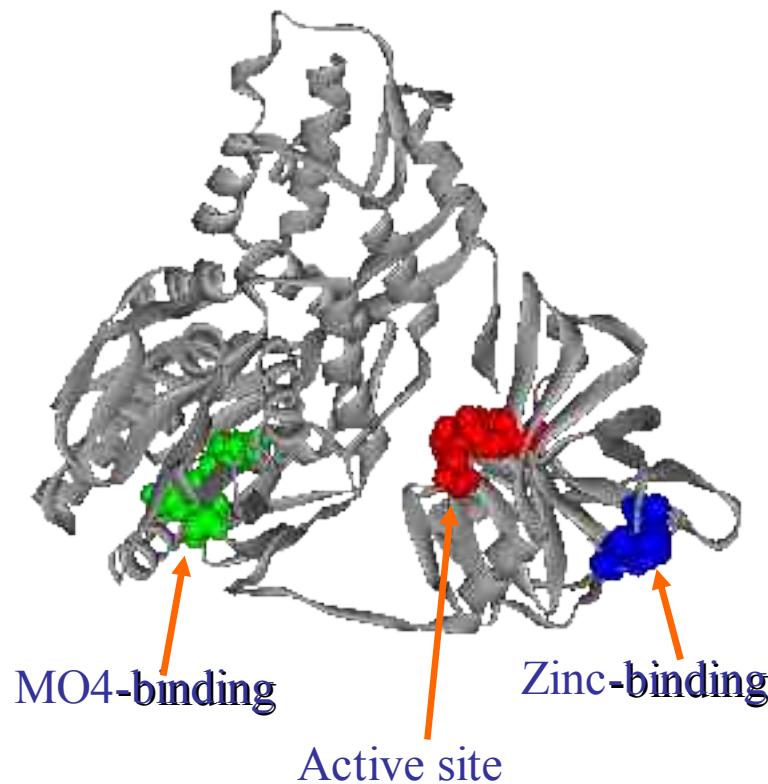

Hepatitis C virus is a member of flavivirus family. It enters the organism in a manner similar to HIV, affects liver. The chronic infection is protracted for 10-15 years, causes liver cirrhosis, provokes cancer, suppresses immune system. The number of virus C hepatitis infected humans in Russia is estimated as 2 millions.

Potential targets for anti-hepatitis C virus drugs

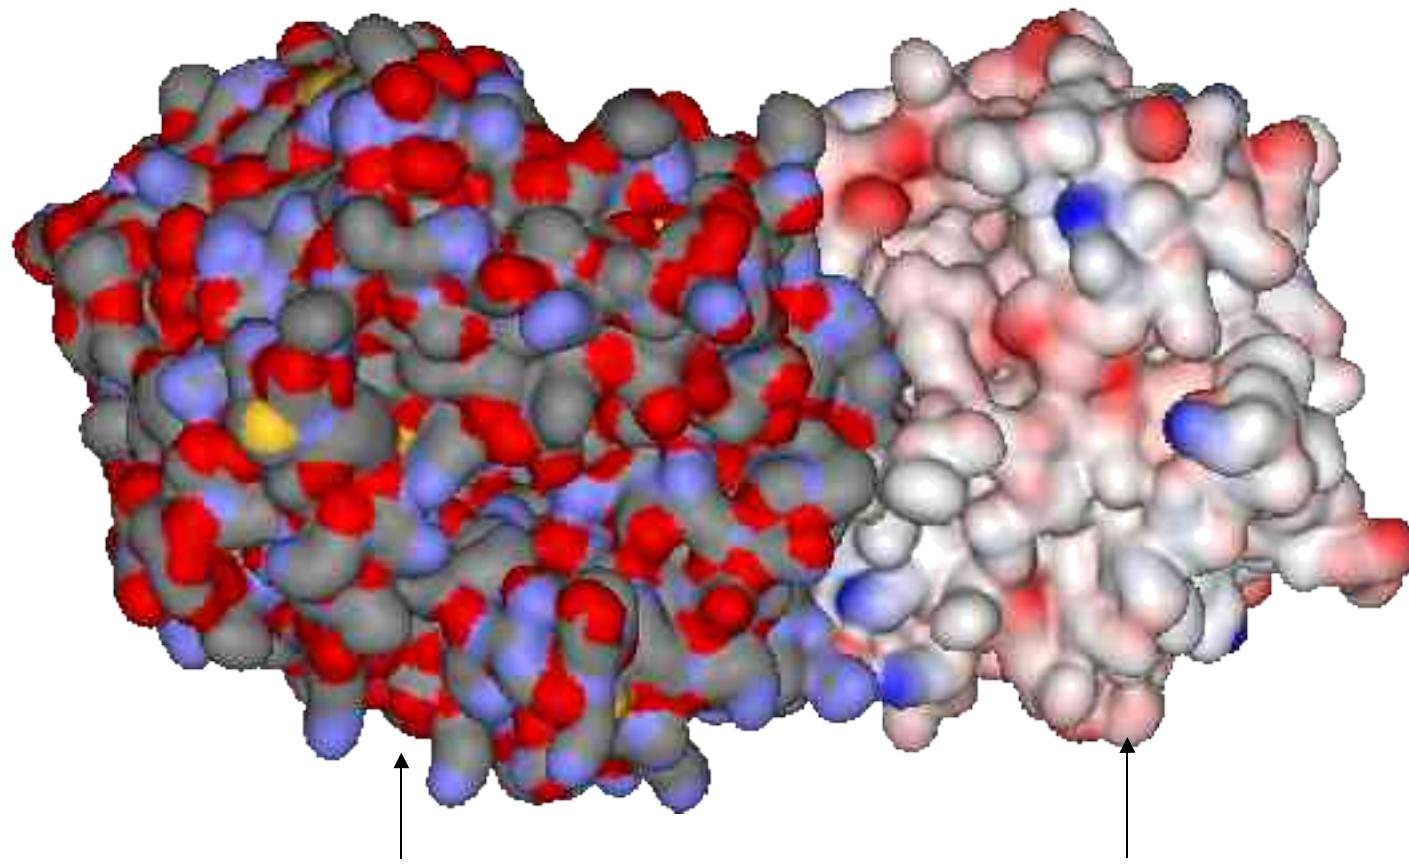

HCV NS5B transferase

HCV NS3 hydrolase

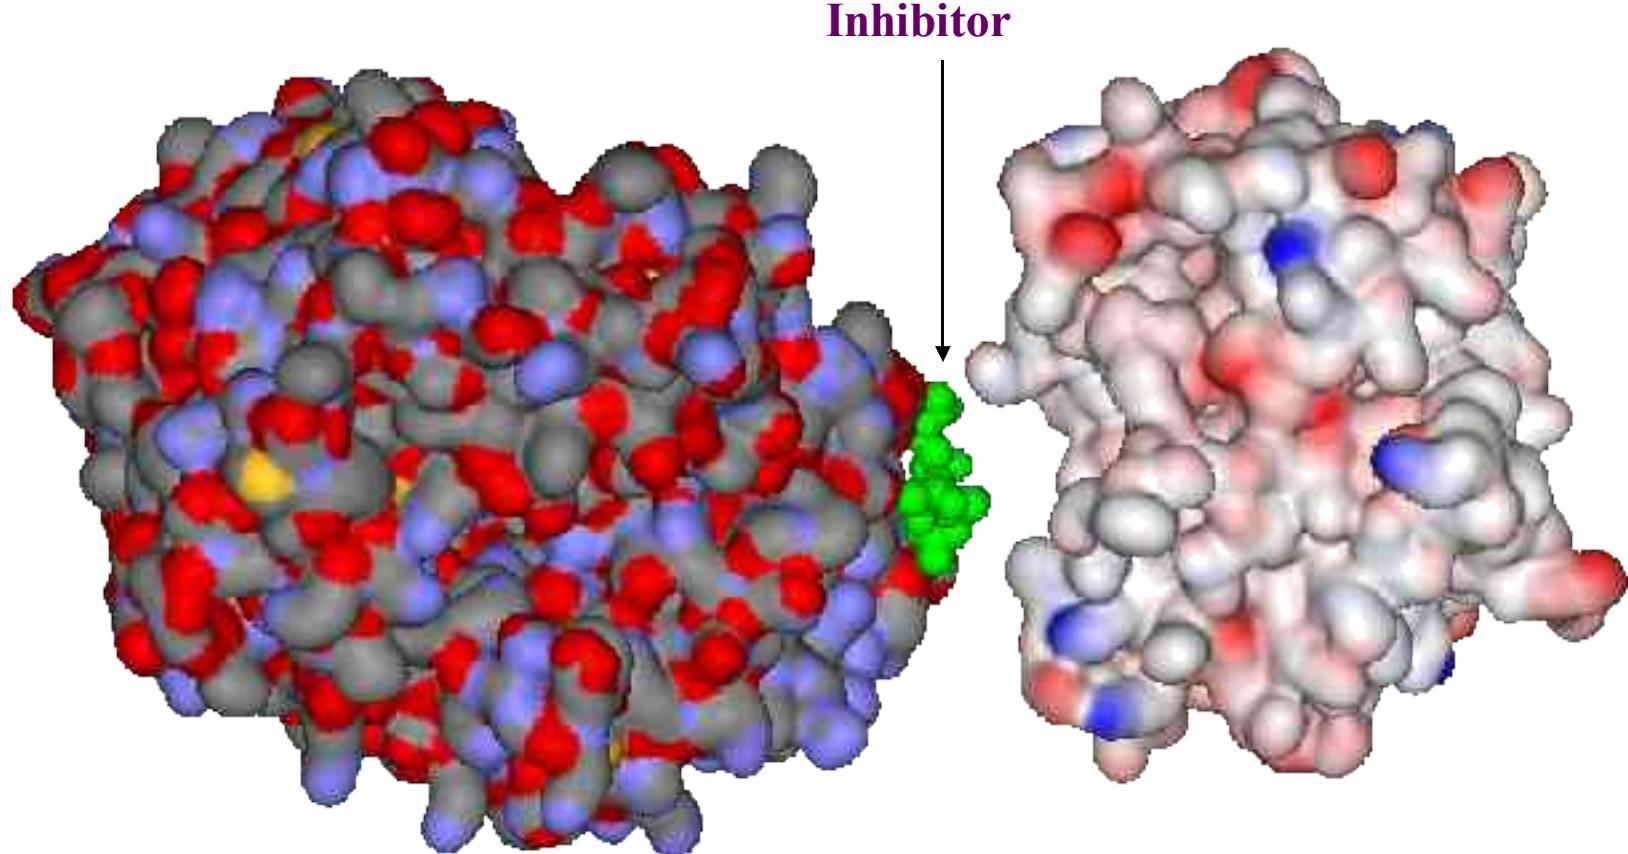

Potential targets for antiHCV drugs

Predicted complex formed by HCV NS5B protein with human NTF2 protein providing transport of proteins to cell nucleus

Potential targets for antiHCV drugs

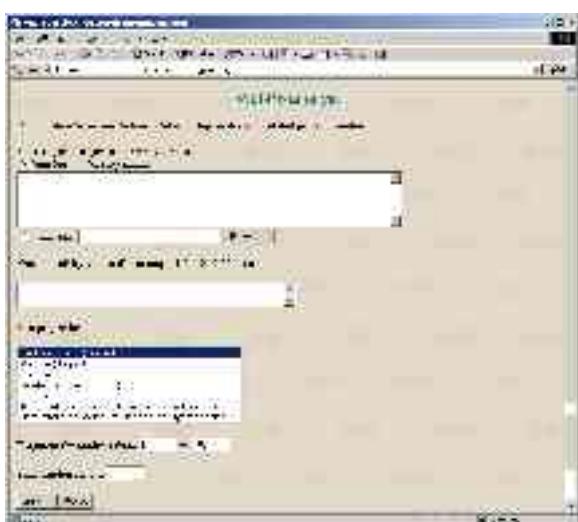

Inhibitor of the formation of NS5B-NTF2 complex prevents NS5B transport into cell nucleus.

WebProAnalyst: a program for analysis of quantitative structure-activity relationships in homologous protein families

<http://wwwmgs.bionet.nsc.ru/mgs/programs/panalyst/>

Multiple alignment of protein sequences

	Sliding window										Activities														
Protein 1	E	I	L	V	E	Q	Y	N	K	A	F	S	A	H	W	K	q	e	I	g	D	D	W	V	I
Protein 2	A	S	L	T	N	A	M	Q	D	I	A	T	I	Q	F	K	K	E	K	G	V	D	V	V	S
Protein 3	-	q	H	K	E	A	A	T	A	N	A	K	A	F	E	Q	E	E	T	G	I	K	V	T	L

x2
x3
x4
x5

Search for significant relation
 $Y = F(X)$

Site physicochemical properties

Examples. Quantitative structure-activity relationships in protein families

Relation between disintegrin capacity to inhibit platelet aggregation and site properties (charge and hydrophobic moment).

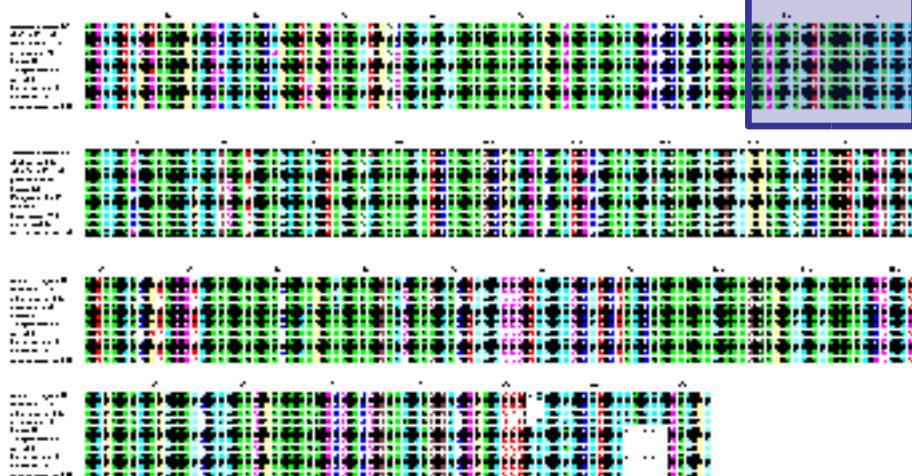

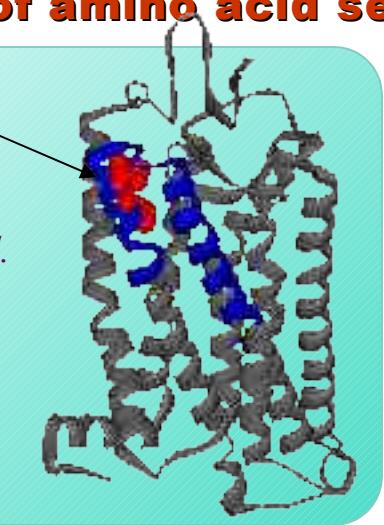

Relation between peptide antimicrobial activity and site hydrophobic moment.

RODOPSIN PROTEIN IS RESPONSIBLE FOR LIGHT RECEPTION IN THE VISIBLE SPECTRUM

We have developed the program for RODOPSIN λ_{max} prediction on the basis of amino acid sequence of this protein

Residues affecting shift of wavelength. The results agree with those of Briscoe et al, Mol. Biol. Evol. (2001).

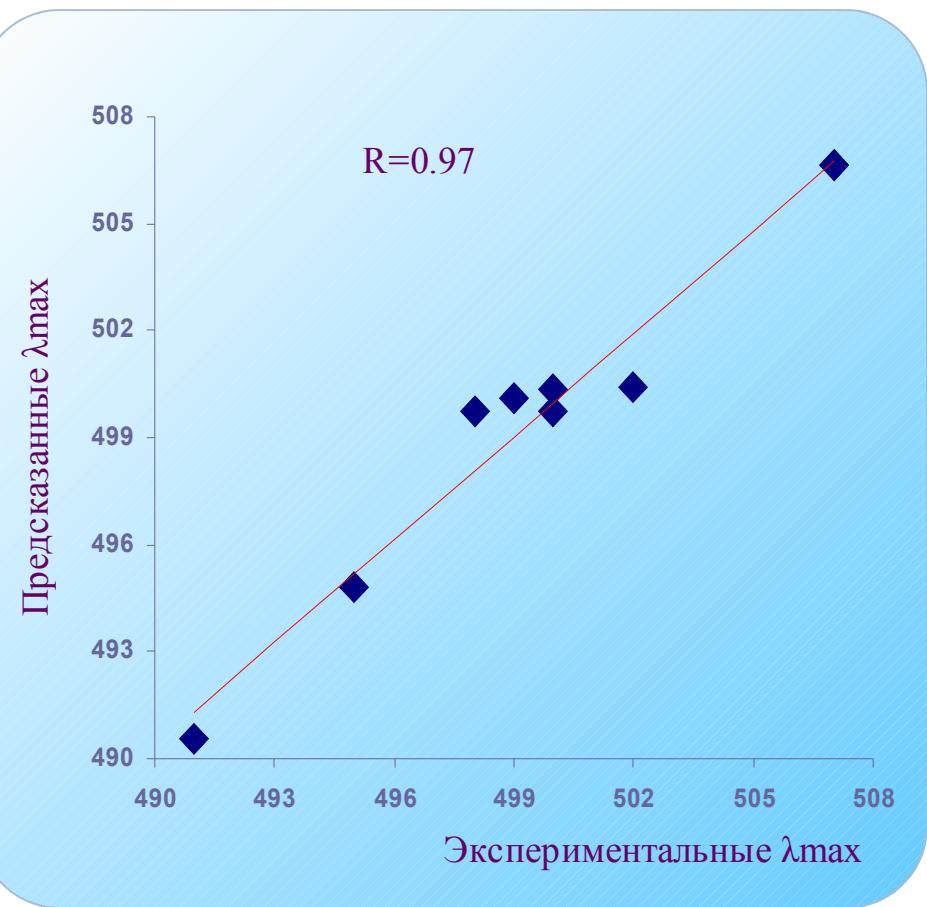

Regression equation:

$$Y = 15.784 * X_1 - 467.266 * X_2 - 37.661$$

X_1 – mean for site isoelectric point (Bogard)

X_2 – hydrophobic moment (Eisenberg)

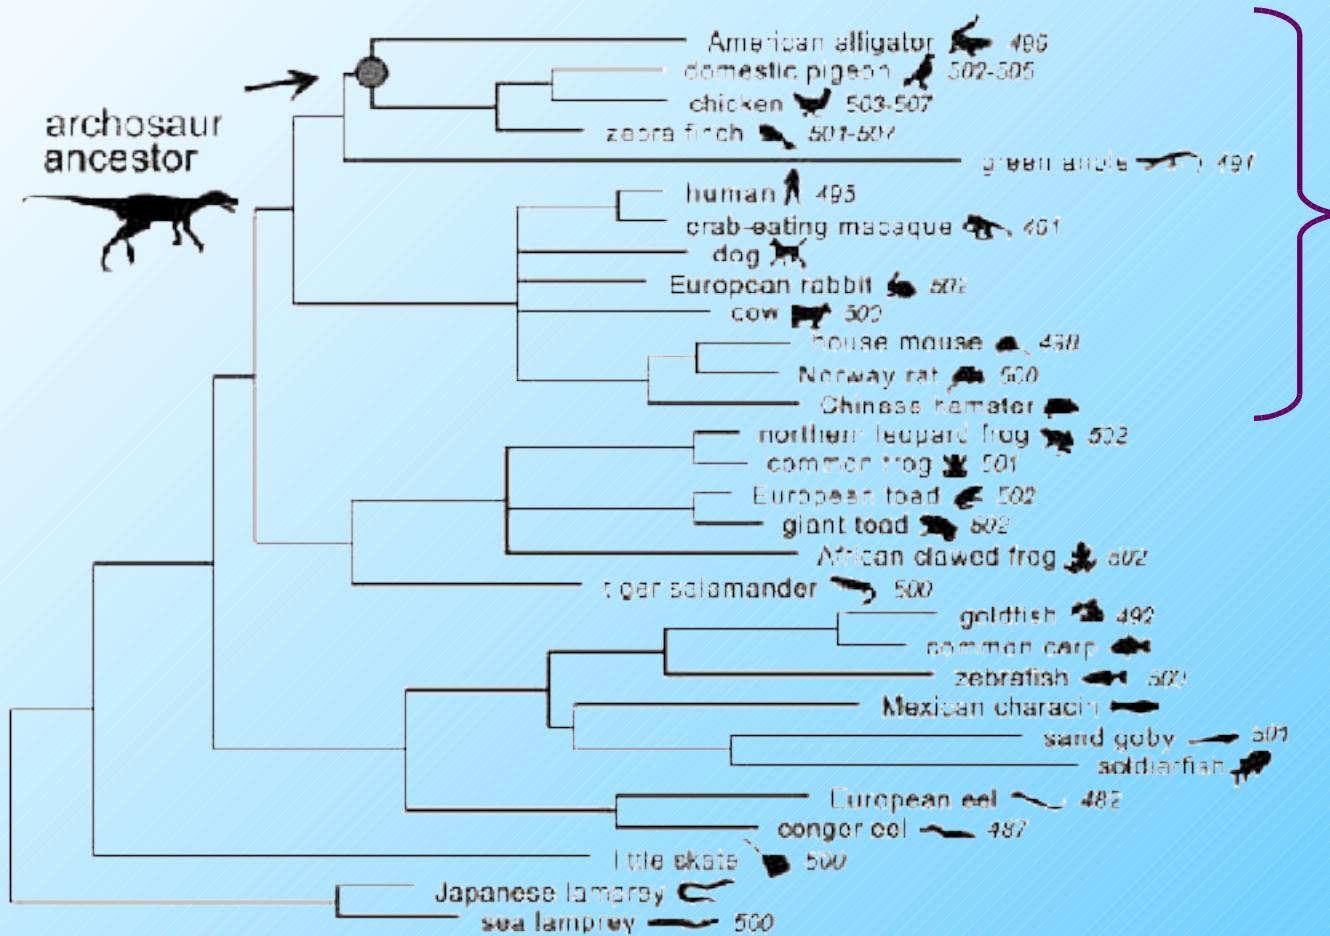

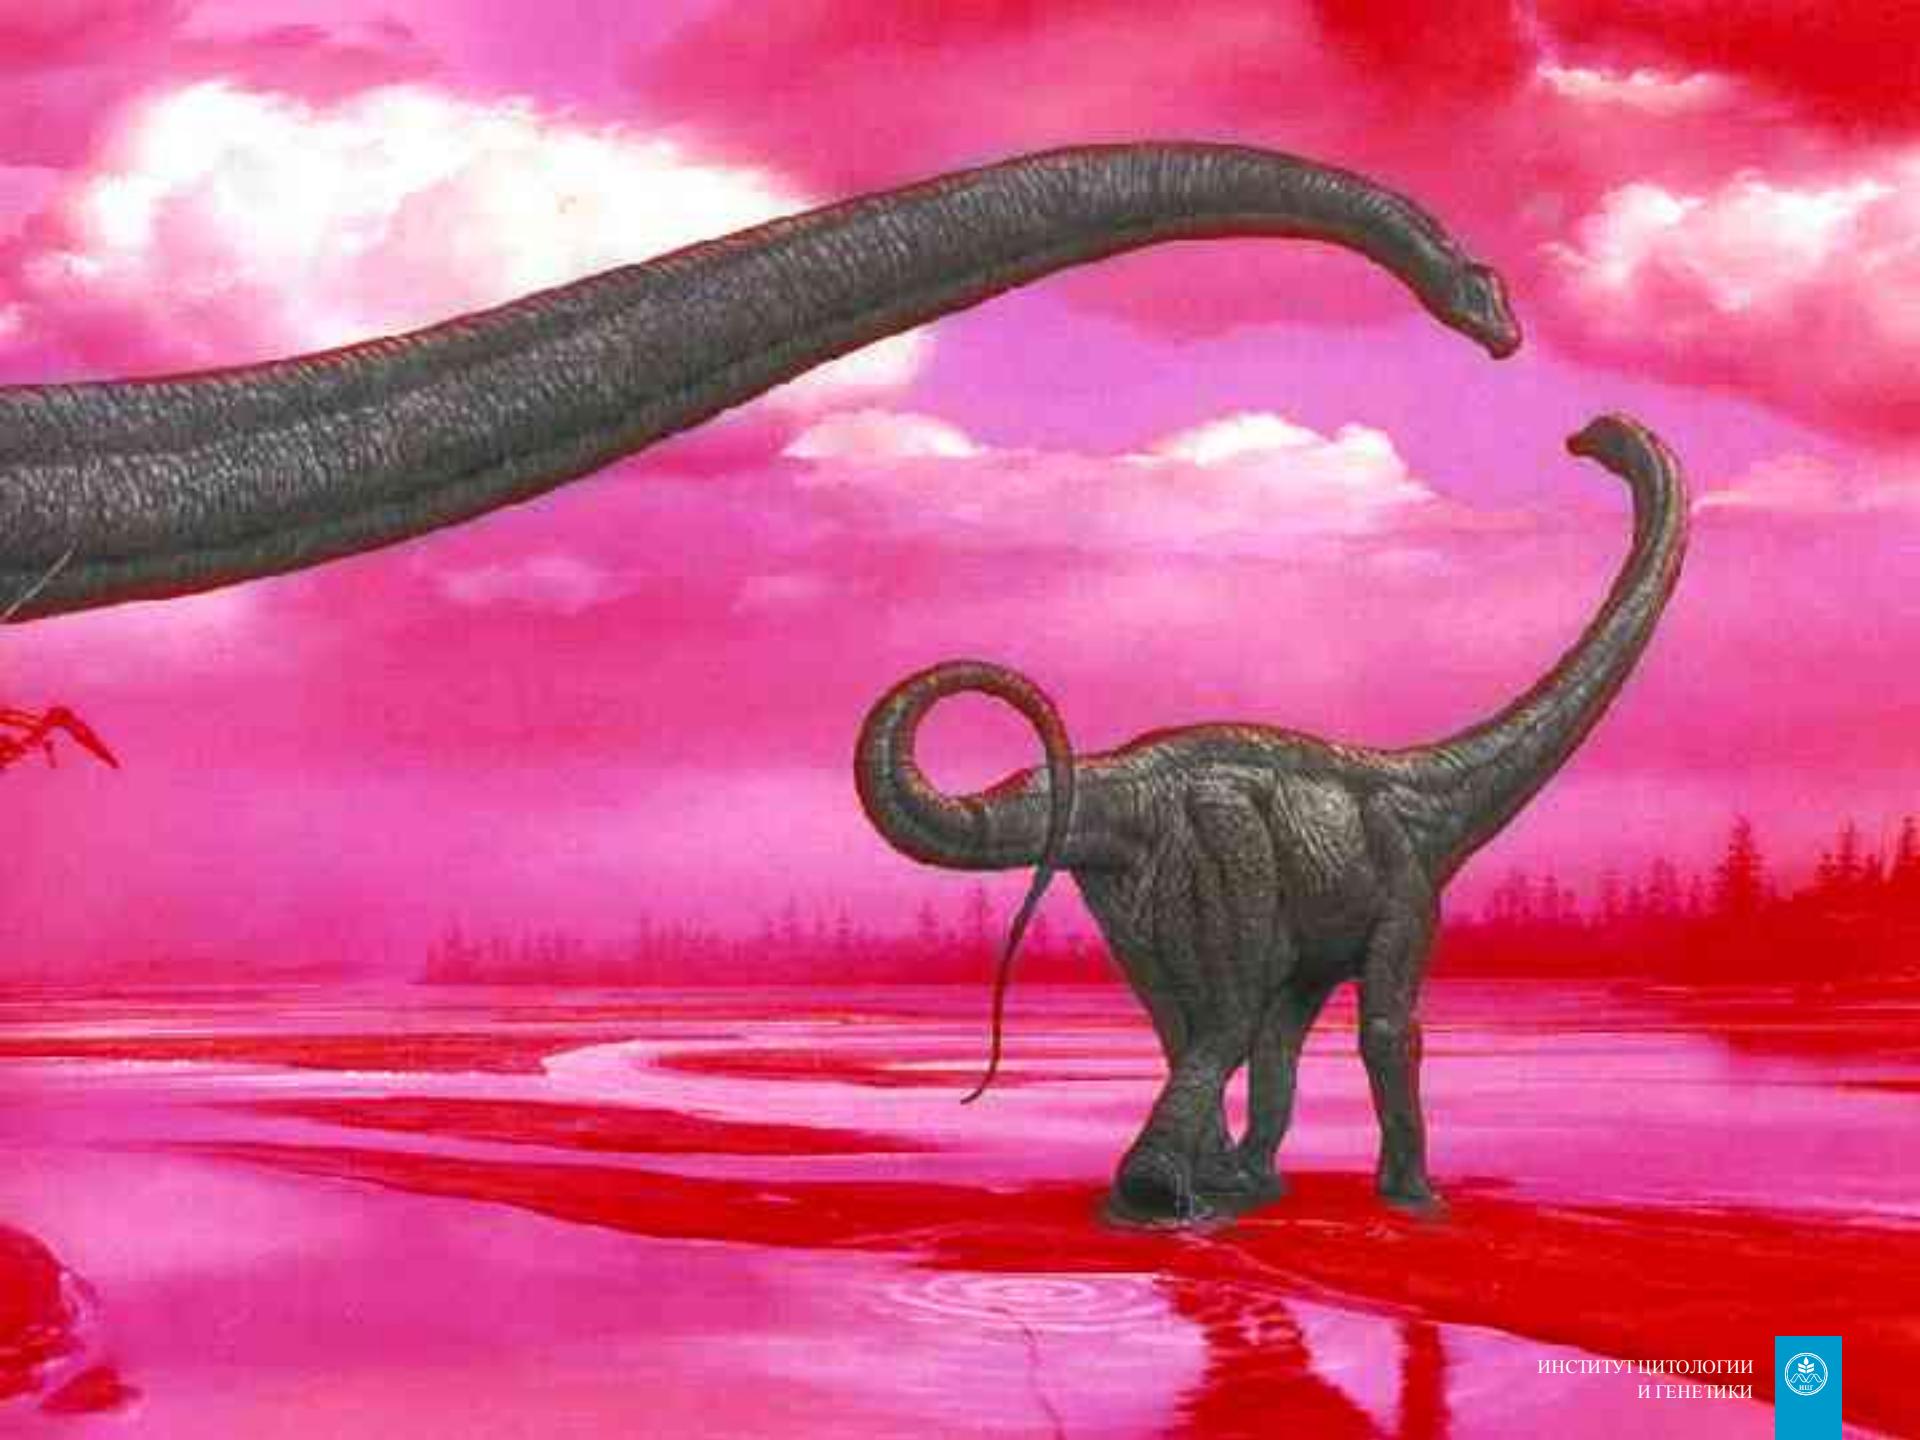

Predicted λ_{max} : $Y = 506.7$

Measured λ_{max} : $Y = 508$

Prediction of the visible spectrum of archosaur sight (λ_{max} for ancestral archosaur rodopsin)
